CHS admin access: the standing order

Decided by the CHS team on 18 October 2026. Built and live the same night (Build 12).

The rules

Rule	What happens
One super admin	Rufus Olushola Timothy. He is the only admin today. Nobody else can be made a super admin.
Admins only by invite	Super admin: Admin > Assign role tab > Invite an admin. Enter the person's phone and the category. A link is made that works once, for that phone only, for 10 minutes.
Who can be invited	Someone who has first signed up normally on CHS with their own phone number. The link upgrades that account to admin.
No other way	The database refuses every other route to admin, including editing the database by hand (it also raises a security alert). The old 'promote by phone' button is switched off.
Login code, every login	A staff admin logs in, then must enter a 6-digit code. The super admin issues it from the dashboard (Admins asking for a login code > Issue code) and reads it out. It works once, for 5 minutes.
3 wrong tries	The account locks. Even the right code is then refused until the super admin taps Unlock. The screen only ever says 'Wrong code'.
120 minutes idle	No activity for 120 minutes and the admin is logged out. The database also cuts admin power at 120 minutes, even if the screen is left open.
Removing an admin	Super admin taps Remove. Access stops at once and the old codes say 'Wrong code'. History is kept.
Super admin	Not asked for a code, so he cannot lock himself out. His account must be protected separately (below).

Super admin: do this before real staff are added

The super admin controls everything, so his account is the one worth stealing. His login today is a phone number and a 6-digit PIN. Turn on authenticator-app two-step sign-in or use a long passphrase on that account, and keep a written recovery plan with the Supabase account owner. If he loses his phone, nobody can get admin codes.

Everything is recorded

Invites, codes issued, wrong tries, locks, unlocks and removals are logged, and the super admin gets a security alert (Platform health page) for invites, new admins, locks, unlocks and removals.

Honest limits

Someone with access to your Supabase dashboard can still change the database directly. The alert will fire, but protect that login (two-step sign-in, separate logins per person). A code read out over a call or WhatsApp is only as safe as that channel: give it only to the admin who asked.
