CHS Round 4 Observations Tracker

CHS — Round 4 Testing Observations: Summary & Tracker

21 real, distinct observations found and organized below, exactly as requested — summarized first, tracker second, fixes to follow in order.

URGENT — blocking your real testing right now

1. Sharon Luke's Guest role application — admin shows "no document uploaded" despite a real upload. My understanding: she added Guest as a role, uploaded a real ID, but the admin review screen says nothing was submitted, blocking approval. This is being treated as the top priority — I will investigate this first, live, against her real record, before anything else on this list.

Real, confirmed bugs

2. Splash screen shows black on desktop/PC, but displays correctly on phone. The logo/splash graphic that works beautifully on mobile appears to not load at all on a PC browser.

3. Developer role: can register as a Developer, but "Developer" is missing from the login screen. Same category of bug as the earlier Host/Guest login gaps — a real account exists with no way to log back in under that role.

4. No field to enter the ID *number* when using an ID type other than NIN. NIN has its own number field, but choosing Driver's Licence, International Passport, or Voter's Card only allows an image upload — there's nowhere to actually type the ID number for that document, so it can never be cross-checked.

5. Admin's "view uploaded document" link goes nowhere / is broken. You've asked directly: shouldn't the document come to CHS first, be reviewed, and only then be stored or discarded — not routed somewhere admin can't actually reach?

6. A specific property (2-bedroom, Gwarinpa) is approved by admin but still shows "pending" on the tenant side, and its real owner cannot be traced at all. You've correctly identified this as a structural problem, not a one-off glitch — every property needs a real, traceable reference tag connecting tenant, admin, and owner, especially before this scales to real volume.

7. Buyer still has no real dashboard/interface. I want to flag this honestly rather than assume: I built a real "My Offers" page for Buyer in an earlier round. If you're still seeing nothing beyond the

homepage, either that update hasn't reached your test build yet, or something is genuinely broken — I'll verify directly rather than guess which.

Real, confirmed gaps (not broken, just missing)

8. No FAQ / Help & Support page. You've supplied a full, real example from a competitor app as a starting reference.

9. No documented PIN-reset process — even you, as the platform owner, don't know how it currently works.

10. No staff/team role-assignment tool for Admin, unlike what Agent and Manager already have.

11. Adding a role currently requires logging out. You want this done inline — the same way "Link Account" works today, but reachable from Settings/My Account without leaving your session, plus a real way to switch between your own roles from any dashboard once you have more than one.

12. No timestamps shown anywhere on the admin panel — registrations, disputes, messages — making it impossible to tell how long something has been waiting.

13. No auto-generated receipts for completed transactions, for CHS's own platform first, and eventually for agents/managers running their own books through it.

Design requests

14. Registration's image/document upload fields are small and easy to miss. You want bold, obvious "Click here to upload" or drag-and-drop styling, matching standard practice elsewhere.

15. Distinct color themes per role/dashboard — you've now raised this twice, referencing a sister app where Buyer, Seller, checkout, and every admin/staff tier each have their own unique, deliberate color identity. I want to acknowledge directly: this hasn't been addressed yet, and it should be.

Needs a real conversation before I build anything

16. What should CHS charge agents/managers for the staff-management tools (team assignment, daily reporting) **they're already using for free right now?** A real revenue model question, not a code question.

17. Multi-platform deployment — PC, tablet, Android, iPhone. You've asked directly when and how this happens. This deserves a real, honest explanation of what's possible now versus what requires a genuine app-store submission process, not a quick line item.

Research assignment, as requested

18. Nigeria-specific legal/regulatory documents a property owner must genuinely hold to prove legal ownership before listing for sale — Certificate of Occupancy, Deed of Assignment, and the like — researched properly, with real sourcing, plus a recommendation on how and when to charge for this verification.

What happens next

I'll go straight into **item #1 (Sharon Luke)** immediately after this, since it's actively blocking your team's testing. After that, I'll work through this list in the order above — confirmed bugs first, then gaps, then design, then the two items that need your input, then the research assignment.
