Vendor and Service Provider test guide

Test data: run `backend-v2/476_round5_marketplace_test_data.sql` once (already applied live; safe to run again). It adds three TEST listings to the demo vendor only: two products and one quote-based service. Do not use the real vendors (Alex Group Ltd) for testing.

Logins (phone, PIN 123456): vendor `08070000002` (Demo Building Materials Ltd), artisan `08070000001` (Demo Artisan Plumber), buyer: `08130000004` (Hotel & Lodge Guest, ₦100,000,000) or `08120000003` (Demo Round2 Buyer). Both are ID-verified. Admin: your own login.

Screen names below are approximate; if a button has another name, note it and carry on.

1. Vendor buys and sells (product with direct purchase)

1. Buyer opens the Marketplace and finds "TEST Floor Tiles 60x60". Check price ₦18,500, stock, delivery note.
2. Buy 2 cartons with a delivery address. Expected: the order is created, the buyer's wallet falls by price plus the buyer commission, the order shows as held in escrow, stock falls by 2.
3. Vendor sees the order, with the buyer's phone hidden. The vendor's money is held, not yet spendable.
4. Release: the buyer confirms receipt, or admin releases. Expected: vendor receives the amount less the vendor commission; the order shows released.
5. Try a refund path through admin: order goes to refunded, buyer is made whole, stock behaviour noted.
6. Edge cases: quantity 0 or more than stock is refused; buying your own product is refused; unverified buyer is refused with the identity message.

2. Service quote (quote-based service)

1. Buyer opens "TEST Site Delivery and Offloading" and sends a request. Write a normal message first.
2. Expected: the request waits for admin review. Admin → marketplace moderation shows it. The vendor does NOT see it yet.
3. Admin relays it. The vendor now sees it, with no buyer contact details.
4. Vendor responds with a message and amount (for example ₦40,000). Expected: the response also waits for admin review, then is relayed to the buyer.
5. Buyer accepts and pays. Expected: wallet falls by amount plus commission, status paid, money held in escrow, then released on completion.
6. Contact protection: send a request containing a phone number or email. Expected: it is blocked, the buyer is told why, and the admin queue does not get it. Repeat for the vendor response.

3. Vendor registration

1. A new test account registers as a vendor with a category. Expected: status pending; admin is alerted.
2. Admin approves: the vendor can list. Admin rejects with a note: the vendor sees the reason. Archived items drop out of the queue after the 7-day archive.
3. A pending vendor's listings are not visible to buyers.

4. Artisan (service provider)

1. Log in as `08070000001`. Check the profile (trade plumber, verified).
2. A buyer or owner books or requests the artisan through the normal artisan flow; check the commission shown matches the labour amount band (`get_artisan_commission_pct`).

3. Complete the job, the customer rates, and a dispute can be raised. Check that admin sees the dispute and a ruling has a real consequence.
4. An unverified artisan cannot take jobs.

Record

For each step write pass, fail or unclear, with a screenshot of anything wrong. Check the wallet balance before and after every money step and write down the numbers.
