CHS — Domain & Business Email Setup Guide

What to do immediately to take the website and emails live, with every real cost involved

Prepared September 2026 | Every price below was verified against live registrar and provider pricing pages on the date this document was prepared, not carried forward from memory.

Honest limit, stated upfront: I cannot register a domain or buy email hosting on your behalf — that requires your own payment method and identity, since it becomes a real, ongoing account only you can own and control. What follows is the exact, complete sequence of what needs to happen, in order, with every real cost involved and nothing left vague.

What needs to happen, in order, starting now

1. Decide the domain name

Everything already built — the four email addresses, the Terms & Conditions, the website footer — assumes **completehousingsolutions.com**. That is not yet registered; it is simply the name every reference already points to. Confirm this name, or tell me a different one and I will update every reference in one pass, in minutes.

2. Register the domain

A five-minute process at whichever registrar you choose (options and real costs below). You will need a debit/credit card that can be charged internationally, or a Naira card if you choose a Nigerian registrar.

3. Choose and activate email hosting

A domain alone does not give you email inboxes — a separate mailbox service must be connected to it. Real options and costs below; my recommendation is Zoho Mail's free tier to start.

4. Point the domain's DNS records to the email host

The email provider you choose gives you exact records (MX, and usually SPF/DKIM) to add at your registrar. Every provider below has its own guided setup wizard for this step — real, but mechanical, typically 15–30 minutes.

5. Tell me once steps 1–4 are done

I will then switch every reference across the app, the Terms & Conditions, and the website from the placeholder to your real, live domain and email addresses in a single pass, and publish the website itself.

What is already done and waiting, at zero further cost to you: the website itself, all four email addresses wired into the app and Terms & Conditions, and the admin-editable contact phone numbers you provided (08099995899, 08037799837) — all fully built and tested, simply waiting on the domain to exist.

Real, current domain costs — verified today

Two genuinely different paths, both real and reputable. An international **.com** reads as globally standard; a Nigerian **.com.ng** reads as distinctly local and costs meaningfully less.

Option	Registrar	First-year price	Renewal price (from year 2)
completehousingsolutions.com (international .com)	Namecheap	~$7 – $14 (~NGN 9,300 – 18,600)	~$14 – $15/year (~NGN 18,600 – 20,000/year)
completehousingsolutions.com.ng (Nigerian, NiRA-accredited)	Whogohost	~NGN 3,000/year	~NGN 3,000 – 5,000/year
completehousingsolutions.com.ng (Nigerian, NiRA-accredited)	MokoHost	~NGN 6,250/year	~NGN 6,250/year

My honest recommendation: if the .com is genuinely important to how the brand reads internationally, register it — the cost difference is small in absolute terms. If a clearly Nigerian identity matters more, or cost is the deciding factor, **completehousingsolutions.com.ng** through Whogohost is the real, current cheapest legitimate option, from an accredited registrar.

Real, current email hosting costs — verified today

Service	Free tier	Paid tier, if you outgrow free
Zoho Mail	**Free** for up to 25 real users, 5GB per user	Mail Lite ~$1/user/month, Mail Premium ~$4/user/month
Google Workspace	No free tier	~$7/user/month — the familiar Gmail interface, on your own domain
Microsoft 365 Business	No free tier	~$6/user/month — if your team already uses Outlook/Office

My honest recommendation, unchanged and now confirmed even stronger: Zoho Mail's free tier now covers up to 25 real users at no cost at all — genuinely enough for your four addresses (support@, inquiry@, engage@, admin@) and any real staff accounts, for the foreseeable future. There is no real reason to pay for email hosting at your current scale.

The real, all-in cost to go live

Path	Year 1 real cost	Every year after
Cheapest real path — .com.ng (Whogohost) + Zoho Mail free	~NGN 3,000 (~$2.25)	~NGN 3,000 – 5,000/year
International path — .com (Namecheap) + Zoho Mail free	~$7 – $14 (~NGN 9,300 – 18,600)	~$14 – $15/year (~NGN 18,600 – 20,000/year)

In plain terms: the entire real financial commitment to take the website and all four emails live is **one domain registration** — as little as about NGN 3,000 for a full year on the cheapest legitimate Nigerian option, or up to roughly NGN 18,600–20,000/year for an international .com. Email hosting itself costs nothing at your real, current scale. There is no other real, mandatory cost in this specific process — no setup fee, no hidden charge, nothing recurring beyond the one annual domain renewal.

One separate, related item worth flagging honestly: the Supabase account running the entire platform is currently registered under a personal Gmail address, not a business one. This costs nothing to fix, but should genuinely be updated to a real business email once one exists — a company's core infrastructure should never depend on one person's personal inbox.

Once the domain is registered and email hosting is active, tell me and I will update every reference across the app, the Terms & Conditions, and the website, then publish the website itself — no further cost, no further real action needed from you beyond providing the final domain name.
