CHS Fix Tracker

CHS — Fix Tracker

How this works: every real item below is logged now, in the order it was raised. Each gets ticked off — ☐ Not started → 🔷 In progress → ✅ Fixed and tested — as real, permanent work is completed, regardless of the order items get tackled in. This tracker is updated every session and delivered alongside the code, so progress is always visible and verifiable, not just claimed.

#	Item	Status
1	Real room/bedroom/toilet dropdowns during listing — replace the single flat number with genuine, selectable counts (rooms, bedrooms 1–5, toilets matching real count)	✅ Fixed and tested
2	A genuinely repeatable “Others” field for extra facilities — click to add one, click again to add another, no limit	✅ Fixed and tested
3	Relabel “Properties” to “Listed Properties” on the owner dashboard	✅ Fixed and tested
4	**Admin cannot review uploaded legal documents before approving a listing** — real access to view/verify C of O, KASUPDA letter, Governor’s Consent, cadastral approval, etc. before a property goes live	✅ Fixed and tested
5	Extend the buyer bio-data fix to the owner/seller side of document verification, as originally requested “across the board”	✅ Fixed and tested
6	Real admin/CHS access to retrieve uploaded property documents — so a soft copy can genuinely be handed to a buyer after a	✅ Fixed and tested

	successful sale	
7	Unique listing ID system — real, permanent ID generated on approval, tied to the owner’s own record, with a real approval/rejection notification (including reason) sent back to the owner	✅ Fixed and tested
8	Virtual Inspection System (VIS) — research required parameters and a real shot list; investigate real tools/methods to convert uploaded still photos into an explorable, labeled walkthrough with per-room dimensions	⬜ Not started
9	House rules upload — real space for an owner/agent to upload rules/regulations, reaching both admin and the tenant	✅ Fixed and tested
10	Court-document upload (the security-deposit alternative) — real space for the legal document confirming the apartment’s true state at move-in/move-out	✅ Fixed and tested
11	“Feature Explainer” — real, hover-based (or tap-based) inline explanations across every feature in the app, for every role	🔷 In progress
12	**Audit Trail** — a real, permanent, tamper-evident log of every significant action across the platform: who did what, to which record, when, and what changed. Added per direct client request.	🔷 In progress

---

A note on item 8 (Virtual Inspection System) and item 12 (Audit Trail)

Both of these are genuinely larger, research-and-design items rather than quick fixes — they'll be worked through carefully rather than rushed, exactly as instructed. Real findings and a real, concrete plan will be shared before either is built, not built blind.

A note on pace

Per direct instruction: no rushing, no shortcuts, and every item is verified with real data before being marked ✅. A "fixed" tick on this tracker means genuinely tested, not just written.

What was actually done — items 1 & 2

Real dropdowns now exist for bedrooms (1–5), bathrooms (0–5), and a genuinely new, separate toilets count (0–6) — toilets no longer share a field with bathrooms. A real "Total rooms" dropdown was added alongside these. The "Others" facility field is now a genuinely repeatable list — add one, add another, no limit — stored as its own real, structured field and shown on the property page as a real list of tags, not just collected and forgotten. Tested directly with a real listing matching the exact scenario raised: 3 bedrooms, 3 toilets, 6 total rooms, with "Visitor's toilet" and "BQ" added as real, separate "Other facilities" entries.

What was actually done — item 3

The owner dashboard's main heading changed from "My Properties" to "My Listed Properties" — confirmed this was the one real instance of the label.

What was actually done — item 4

Confirmed the real, serious root cause directly: the screen where admin approves a new listing (making it live and visible to the public) showed only the title and location — genuinely zero document information, on a completely separate tab from where documents could be viewed. An admin approving a listing had no reason to even know a document review screen existed elsewhere. Fixed properly: every real uploaded document now shows directly on the same card admin uses to approve the listing, with its own real "view" link and its own verify/reject buttons — no more jumping between tabs. For Sale properties specifically — where the real stakes are highest — the "Verify" button is now genuinely disabled until every document is verified; it isn't just a warning that can be ignored. Tested directly: created a real sale listing with one real, unverified document, confirmed the block, verified the document, and confirmed the block correctly lifts.

What was actually done — item 5

Confirmed the real gap directly: the listing-approval card (fixed in item 4) showed the property's documents but had zero visibility into who the owner actually is — no name, no phone, no ID-verification status, exactly the gap that used to exist on the buyer side before that was fixed. Now shows the owner's real name, phone, and a genuine ID-verified status directly on the same card. For Sale properties specifically, the same real hard block from item 4 was extended: if the owner's own ID isn't verified, the "Verify" button is disabled with a clear reason shown, not just a visual note. Tested directly: temporarily set a real demo owner's ID to unverified, confirmed the correct block condition, then restored their real verified status.

What was actually done — item 6

Found and fixed a real, related bug while working this item: the buyer's own document-download screen (after a successful purchase) showed *every* uploaded document for a property, regardless of whether CHS had actually verified it — meaning an unverified or even rejected document could have reached a buyer. Fixed to show only genuinely verified documents.

Then built the actual real access CHS itself needed: admin's "Trace an Account" tool — already used to look up a real person's full wallet, promotions, and requests — now also surfaces every real property that person has ever listed, and every real document tied to each one, with a working view link and each document's real verification status. This works regardless of whether the property is still pending, already sold, or was rejected — a permanent, searchable record, not something that only exists during the brief approval window. Tested directly with a real demo owner: traced their account, confirmed their real properties show correctly, added a real, verified document, and confirmed it appears with a working link.

What was actually done — item 7

A genuinely surprising finding while investigating this one: a real, working, sequential reference number system (PROP-000001, PROP-000002, and so on) already existed in the database, generated automatically the moment a listing is created — and a real approval/rejection notification system, including a place for a real rejection reason, already existed too. Two real gaps closed: (1) the owner could never actually see their own property's reference number anywhere on their own dashboard — now shown directly on each listing card; (2) admin had no real way to type in a rejection reason at all, despite the system being fully built to use one — every rejection silently fell back to a generic message. Admin can now type a real reason, and it's required before a rejection can be submitted. Tested completely end to end with real data: created a real listing, rejected it with a real, specific reason through the actual dual-admin approval flow, and confirmed the owner's real notification quoted that exact reason, word for word.

What was actually done — item 9

Checked directly before building anything: a real, complete house rules upload already existed — owner upload, tenant acknowledgment, and a basic admin count were all genuinely built and correctly scoped (only shown for rent, lease, short-let, and rent-to-own, since it makes no sense for a sale). The one real gap: admin had a count, but no actual way to open and view an individual house rules document. Fixed by adding real house rules visibility directly into the same account-tracing tool built for item 6.

What was actually done — item 10

Checked directly before building anything: a real move-out condition report already existed, requiring a genuine court affidavit upload before it could be submitted — exactly what was described. The real, confirmed gap: admin had absolutely no way to see any of it. Built a real, dedicated section (under Disputes, since move-out condition issues are directly related) listing every real move-out report with an affidavit attached, with a working view link to the actual document. Tested directly with real data: created a real tenancy and a real condition report with an affidavit, confirmed the exact join and data structure the admin screen relies on returns correctly.

What was actually done — item 11 (genuinely in progress, not complete)

Being honest about scope here: with 100+ real features across the app, this cannot be finished in one pass, and marking it “done” would not be accurate. What’s real and working right now: a genuine, reusable tap/hover explainer component, built mobile-first (a tap opens it, a tap elsewhere closes it — hover works too on desktop). It’s already live on five real, previously-confusing terms: Rent Savings, Maintenance Reserve, Agent Earnings Paid, Pending Earnings, the Sale/Rent/Rent-to-Own/Short-let purpose choice, and the shortlet security deposit. The real foundation is proven and working — extending it across the rest of the app’s real features is the remaining work, and will continue as its own, ongoing item rather than be rushed to a false “done.”

What was actually done — item 12 (genuinely in progress)

A real, permanent audit_log table now exists — no update or delete permission exists for it at all, for anyone, by design, since an editable audit trail defeats its own purpose. A real, reusable log_audit_event() function lets any part of the system record a real entry in one line. Wired into the real, highest-stakes actions first: every property verification/rejection, every dispute ruling, every real fund release from escrow, and every account suspension/reactivation. A real, searchable admin screen (Audit Log tab) now shows every entry — who did it, their role, what it was, the real target, and full details — searchable by action or target. Caught and fixed two real mistakes of my own while building this: a JSX structural error where an edit accidentally deleted a needed line, and a React warning about state updates in an effect — both caught by the same full build check before this ever reached testing. Tested directly with real data: logged a real test entry and confirmed the exact query the admin screen depends on returns the correct actor name, phone, action, and details.

Honestly incomplete still: many other real actions across the app (marketplace moderation, referral payouts, agent management changes, and others) don’t write to this log yet. Extending coverage continues as ongoing work, the same as item 11. Since the last update, real logging was added to all three admin relay functions (rental application, offer submission, offer decision) and agent referral payouts — tested end to end with real data.

Two real, additional fixes per direct client report — after login and colors were confirmed working

Buyer phone number missing from admin’s offer review. Confirmed the exact real gap directly: the phone number was captured correctly at the moment of offer submission, but the admin review screen’s query simply never selected it — an oversight in the original build, not a data problem. Fixed on both the initial-review screen and the owner-decision screen. Confirmed with the client’s own real, existing test offer (Ayomide Praise, 08078837789) that the underlying data was there and ready to surface the moment the query was corrected.

Approved/rejected properties and registrations disappearing permanently. This is a genuinely serious finding worth being honest about: the real backend function for this (built earlier, for rental applications and offers) was never actually connected to a real screen admin could open — a real gap between “built” and “visible,” the

exact kind of thing that made “done” not hold up under testing. Fixed properly this time: extended the same function to also cover property listings and registrations, added the real timestamps needed to sort them accurately, and — critically — built the actual admin screen (a new “Processed History” tab) that was missing the whole time. Tested completely end to end with real data: verified a real test property through the full two-admin approval process, and confirmed it correctly appears in Processed History with its real reference number, title, and decision time — nothing lost, nothing disappearing.

Update, 14 October 2026

#	Item	Status
1	60% advance to event centres and service providers, release, clawback, admin buttons	✅ Built and tested (rolled-back runs); needs live payment test
2	Event risk class, private booking documents, licensed capacity with admin verification	✅ Built and tested
3	Venue profile (parking, power, fire safety), seating layouts with diagrams and capacity per layout	✅ Built and tested
4	Hotel: several rooms per request, adults and children, pay all rooms at once, stay extras, public ratings	✅ Built and tested (pay-all tested to the pay step only)
5	Search by dates, accessibility filter and tags	✅ Built and tested
6	Weekly and monthly long-stay discounts	✅ Built and tested
7	Group and corporate enquiries	✅ Built and tested
8	Open fields and stadiums: categories and ground details	✅ Built; rain plan and crowd limit shown, not enforced
9	VAT recording on CHS fees (off by default, VAT-inclusive, ledger, report, CSV)	✅ Built and tested; switched off; accountant to confirm
10	Anonymous access removed from 18 new functions	✅ Fixed and re-checked
11	Feature catalog PDF and spreadsheet were missing sections 17 and 18	✅ Fixed: regenerated in full
12	Terms V9 terms 45 to 47 written	✅ Written; NOT active; lawyer review needed
13	Charge VAT on top of CHS fees (changes what people pay)	☐ Not started, not requested
14	Revoke anonymous access on the other 306 privileged functions; fix 2 security-definer views; leaked-password protection	☐ Not started
15	Platform earnings tab to include service fees	☐ Not started
16	Admin relay for change-request answers and host-initiated chat	☐ Not started
17	Host calendar grid and iCal to show event sessions	☐ Not started
18	Lawyer review of Terms V9 and the word escrow; CAC; launch switches	☐ Needs you

Update 2, 14 October 2026: managing hotels, event centres and open venues

- Management requests are now open to commercial hire properties from the Host and Owner pages. The database requires proof of ownership, the operating permit or licence, public liability insurance and, for event centres and open venues, a fire safety certificate.
- On a CHS-managed hotel, event centre or shortlet the host-side booking commission is not charged (trigger managed_no_host_commission_t, function _chs_managed_hospitality, pricing patched). The guest-side fee and service fees are unchanged.
- Management terms version 3 adds section 6A (event centres, halls and open venues).
- Open: no expiry tracking on the permit, fire and insurance documents; renewal-year rent commission on managed rentals unchanged; lawyer review.
