CHS placeholder and test-data audit

18 October 2026 - Build 10 - for the CHS team

What this is

The team asked for a full check for anything that looks real but is not. We read all screens' static text, the settings table, all data tables' contents (counts, owners, money) and the message system, and tested the message sender live. Items below are what we found. Things we could not check from here are listed as such, not assumed fine.

A. Found and fixed now

#	Item	What was found	Severity	Status
1	Reminders (rent, inspections, events etc.)	The sender marked every reminder 'sent' even when the email or SMS never left. Email was also in Resend test mode (from 'CHS Test'), which only delivers to one address.	High	FIXED in code and database: each channel result is recorded, failures show as failed, errors never stop the batch; sender address now comes from a setting. Live.
2	Urgent-sale hotline	The number was a dummy '+234-XXX-XXX-XXXX' that would have been shown to users.	High	FIXED: dummy removed, the call line is hidden until a real number is set (needs the number from you).
3	Area guide menu item	A menu entry labelled 'Coming soon' with nothing behind it.	Medium	FIXED: removed (needs the new zip).
4	Demo and TEST data mixed with real data	37 of 53 accounts are Demo or TEST accounts holding about N1,125,794,562 of test wallet money; 840 of 843 properties, 9 of 10 vendors and 79 of 84 products belong to them.	High	FIXED (reversible): all flagged as test data and hidden from the public and from real users. Test accounts and admins still see them so testing continues. Nothing deleted. Admin page 'Platform health' shows the real/test split.
5	No visibility of delivery failures or security events	Nobody was told when messages failed, a role or setting changed, a large release or withdrawal burst happened.	High	FIXED: security alerts to super admins (in-app) and a super-admin Platform health page (needs the new zip for the page).

B. Needs something from you

#	Item	What was found	Severity	What is needed
6	Email sending domain	Email still uses Resend's test sender, so real users do not receive email.	High	Verify a CHS domain in Resend (DNS records), then set the RESEND_FROM secret to an address on it. No code change needed.
7	N60,000,000 in one non-test account	Ahmed jimoh's wallet holds N60,000,000 with no transaction record at all, so it did not come from a payment. A second account (Alex) holds N1,032,000 with 3 records.	High	Tell us whether to zero these (recorded as an audit adjustment) or keep them. We have not changed them.
8	Urgent-sale hotline number	Empty now.	Medium	Give us the real number or enter it in Admin > Settings.
9	VAT details	VAT TIN and registered-since date are empty, so VAT invoices cannot carry them.	Medium	Your accountant must confirm if CHS is VAT-registered and give the TIN and date.
10	Test accounts and test money	Decide: keep for testing, or remove before launch.	Medium	Your decision. Removal is a deliberate step we will do with a backup and your written go-ahead.
11	Face / liveness check	There is no biometric provider. The check is a photo sent for human review and is labelled that way.	Medium	Decide: keep human review, or choose a KYC provider (cost and contract).
12	Paystack live mode	We cannot see from the database whether the Paystack key is live or test.	High	Confirm in your Paystack dashboard that live mode is on, KYC is complete and the webhook URL is set. Real money only moves in live mode.
13	SMS sender name and WhatsApp	SMS goes through Termii with sender ID 'CHS'. We cannot see if the sender ID is approved or WhatsApp is enabled.	Medium	Check the Termii dashboard: approved sender ID, WhatsApp template approval, balance.
14	ID verification AI check	Needs the ANTHROPIC_API_KEY secret; super admin only. Cannot see from here if it is set.	Low	Confirm the secret exists in Supabase if you use it.
15	Terms and Conditions V9	Still a draft, not active.	Medium	A lawyer must review before it goes live.

C. Not built yet, or working as designed

#	Feature	State	Severity	Plan
16	Courier / delivery partner API	Deliveries are handled by CHS admin and vendors manually; no courier integration exists.	Medium	Choose a courier; we integrate.

#	Feature	State	Severity	Plan
17	CHS drop-off centres	Not built (zero centres, no table).	Low	Send addresses; we build when needed. Switched off until then.
18	Mixed room types, host room swap	Not built.	Low	On the build list.
19	Services (artisans)	Quote-based, not fixed-price. Two artisans on file.	Low	Working as designed.
20	Blog, About, Privacy	Real written content held in the app (not in a database). Changing text needs a new release.	Low	Fine; tell us if you want it editable by admin.
21	Market demand page	Real but empty (no demand recorded yet) - it shows an honest empty message.	Low	Fills as people search.
22	Host 'Whole property' room	A default first room, renameable. A real design choice, not a placeholder.	None	None.

Not checked

Dashboard-only settings: Paystack, Resend, Termii, Supabase and GitHub account security; the real iPhone behaviour. These need you or a device test.
